Answer all questions and turn in before leaving class today. Include your work for partial credit.

For this question set, assume that I have a process A . The virtual address space for this process has a base at 16 000 and bounds (or limit) of 16 000. There is no cache. For each scenario below, answer the following :

- Should this value be read from physical memory?
- If so, what is the physical address at which this instruction is stored?

1. Process A wants to read an instruction from virtual address 128.

2. Process A wants to read data from virtual address 15 000.

3. Process A wants to to read data from virtual address 17 000.
