

Name: _____

Assume there are three holes in the free list with the following sizes (in order).

- Hole 0 : 200KB
- Hole 1 : 600KB
- Hole 2 : 100KB

Assume an entire process's address space must be loaded into memory, contiguously (no paging). Also, assume processes with the following memory requirements need to be loaded into memory (in order).

- Process 0 : 100KB
- Process 1 : 200KB
- Process 2 : 600KB

For each of the following methods, explain which processes are allocated in each hole. State if any process cannot fit in any hole.

1. Explain in which holes each process is allocated when using **first fit**.
2. Explain in which holes each process is allocated when using **best fit**.
3. Explain in which holes each process is allocated when using **worst fit**.
