

Name: _____

Assume I have three threads that execute the code specified in the parts below. Assume the value in counter was initialized to 50 before the threads began. For each part, list all possible values for counter after all three threads complete.

1. `void* thread_func(void* arg)`
 {
 `(int*)counter = (int*)arg;`
 `*counter = *counter + 1;`
 }

2. `void* thread_func(void* arg)`
 {
 `(int*)counter = (int*)arg;`
 `lock(&mutex);`
 `*counter = *counter + 1;`
 `unlock(&mutex);`
 }

where the lock is a global variable and was initialized before the method.
