

Test 1 Review

02/23/2021

Professor Amanda Bienz
Processes, CPU Scheduling

Processes

- What is the difference between a program and a process?

Process Methods

- What do the following methods do?
 - `fork()`
 - `wait(NULL)`
 - `exit(0)`

Process Methods

Main Method:

1. `pid = fork()`
2. `if (pid == 0)`
3. `child_method()`
4. `else if (pid > 0)`
5. `parent_method()`
6. `else`
7. `print("Why am I here?\n")`

CPU Scheduling

- Jobs arrive in the order :
 - A takes 10s
 - B takes 100s
 - C takes 1s
- All jobs arrive at $t=0$
- Schedule with FIFO, SJF, SRJF
 - Which job is executed first?
 - What are the pros and cons of this scheduling algorithm?

Priority + Round Robin

- How are jobs with different priorities scheduled?
- How are jobs with same priority scheduled?
- What are the pros and cons of this method?

MultiLevel Priority Feedback Queue

- What are pros and cons of jobs dynamically changing queues?
- When do we decrease priority of job? Why?
- Why do we use priority boost?
